

Engineering Specialist Services – Assessment of plant

Verification of remedial work for equipment used in lifting operations

We are able to verify, where issues have been raised during thorough examinations, that the lifting equipment concerned has been suitably repaired or replaced.

What does the service include?

- Providing advice on the suitability of the proposed remedial work and testing.
- Reviewing any documentation associated with the work undertaken.
- An expert assessment of the work undertaken, including comments on the suitability of the item to return safely into service.
- A thorough examination indicating the equipment is safe to be returned to service.

Who does it affect and why?

It is a legal requirement to ensure that lifting equipment is not used unless it is safe to do so. Once serious defects have been identified it is important that a robust procedure is adopted to ensure the item of equipment is suitably repaired and certified fit for continued use.

This service allows employers to demonstrate that a clearly defined and certified repair procedure has been adopted before the equipment is again provided for use by their employees and the general public.

Our approach

Zurich has many years' experience in the examination and certification of lifting equipment. We are able to provide a completely impartial and independent service.

This service can be arranged by contacting our main office or simply speaking to your local Engineer Surveyor on site.

From our main office in Birmingham, we monitor examinations performed by our nationwide network of Engineer Surveyors. They are supported by Senior Engineers who review the test results and certification before issue to the customer and provide technical support.

Linked services include the acceptance of supplementary test results for lift installations.
